

# Lithium Battery Operation Best Practices

## Charging:

Always use the charger authorized by the battery manufacturer. When in doubt, consult your manager.

Always keep the battery plugged into the charger when not in use.

Never charge the battery through the truck connector.

Always ensure that the connector is fully inserted into the charging port.

## Safety:

Never touch the electrical parts of uninsulated battery terminals.

Inspect the battery and cables for damage every day before use. If defects are found, do not use them. Keep them away from flammable materials.

Certified technicians must be contacted for any service event.

In the event of a battery drop/impact, it must be inspected by a certified technician before being put back into service. Battery-swapping is not recommended as a best practice.
